

Cromemco Software Update Service Note CDOS-5

Date: November 17, 1983

Product: DOS-L and DOS-S

Release: 12

Date production of this version began: Nov. 17, 1983 on 8"
Nov. 17, 1983 on 5"

First serial number with this version: 12-10000 on 8"
12-10000 on 5"

SUMMARY

Version 02.58 of the Cromemco Disk Operating System (CDOS), corrects several software problems that were found in the previous release.

CORRECTIONS

This release corrects a problem with random disk I/O. In the previous release, the Read Random Record system call modified the extent number in the user FCB if an attempt was made to read a random record in an extent that didn't exist. This problem prevented certain applications, such as dBASE II, from running correctly.

In previous versions of CDOS, the Read Track and Write Track system calls worked correctly only with single-density diskettes. Now the system calls work correctly for all diskettes.

Versions 2.54 and 2.56 of CDOS did not operate PerSci floppy drives efficiently. This problem has been corrected, and PerSci drives now work at full speed.

Previous versions of CDOS did not work correctly with both HD-20 and HD-11 hard disk drives on the same system. This problem has been corrected.

Screen Editor Program

In past versions of the Screen program, the Exit command with the Continue option could corrupt the file being edited. In version 1.45 of Screen, the Exit command with the Continue option works properly.
